4. **Claim 1 is now amended to be:**

1. (currently amended) A controller for a memory having at least one memory cell, that involves a higher cost for writing than for reading, said memory cell being allocated a first address information and adapted to store memory data, said memory controller comprising:

a register connected with said memory, and comprising register space for write data and for address information allocated thereto;

a write controller connected with said register and said memory, and adapted to:
receive a write request comprising said first address information and first write data allocated thereto;

store the first write data and the first address information to said register;
ascertain whether said first address information is equal to second

address information for a pending write request stored in said register, wherein said pending write request comprises said second address information and corresponding second write data;

if yes, determine if said first write data stored in said register is different from said second write data of said pending write request stored in said register and initiate a write operation of said first write data to forward said first write data from said register to said memory in response to a determination that said first write data is different from said second write data;

if no, compare said first write data with said memory data allocated to the first address information and initiate a write operation of said first write data to forward said first write data from said register to said memory in response to a determination that the first write data is different from said memory data

Formatted: No widow/orphan control

5. **Claim 14 is now amended to be:**

7. **Claim 17 is now amended to be:**

17. (currently amended) A method for writing to a non-volatile memory using a writing queue, said memory comprising at least one memory cell for storing memory data, said memory cell being uniquely allocated at least a first memory address and requiring a higher cost for writing than for reading, comprising the steps of:

receiving a write request comprising the first address information and first write data allocated thereto;

storing the first write data and the first write address to said register;

ascertaining whether said first address information is equal to second address information for a pending write request stored in said writing queue, wherein said pending write request comprises said second address information and corresponding second write data;

if yes, determining if said first write data stored in said register is different from said second write data of said pending write request stored in said register and writing said first write data from said writing queue to said memory cell corresponding to said first address information in response to a determination that said first write data is different from said second write data;

if no, comparing said first write data with said memory data allocated to the first address information and writing said first write data from said writing queue to said memory cell corresponding to said first address information in response to a determination that the first write data is different from said memory data

Formatted: No widow/orphan control
